General to Vacuum Pump Systems

Overview

A continually increasing number of applications in industry and research are relying on vacuum technology. Thus widely differing requirements result regarding the vacuum generating systems.

The comprehensive range of vacuum pumps from Leybold offers, in combination with the matching accessories, all options of selecting the optimum pump system for your application in each case.

Based on the longstanding experience in the design and manufacture of vacuum pump systems, Leybold offers standardized pump systems which will match most applications – the RUTA pump systems.

RUTA pump systems excel by being compact, reliable and service-friendly.

The pump systems are equipped as standard with 400 V, 50 Hz three-phase motors.

Motors for special supply voltages, special mains frequencies or explosion protected pumps are available.

Standards

Leybold pump systems are rated according to CE, ISO, DIN and VDE regulations. Compliance with other standards is possible upon request.

The technical data of the vacuum pump systems given in this catalog part are based on the PNEUROP Acceptance Specifications for Vacuum Pumps, Part 1, and comply with DIN 28 426. The characteristic curves in our pumping speed diagrams are plotted in accordance with DIN 28 426. The curves represent the mean of several measurements. Our warranty refers to the values indicated in the technical data table.

Designation of Roots Vacuum Pump Systems

Leybold pump combinations of Roots vacuum pumps with backing pumps are called “RUTA”.

In order to identify the standard pump systems the name “RUTA” is followed by the brief designations of the pumps which make up a particular pump system.

Brief designation of the largest Roots vacuum pump (Pumping speed of the pump system)

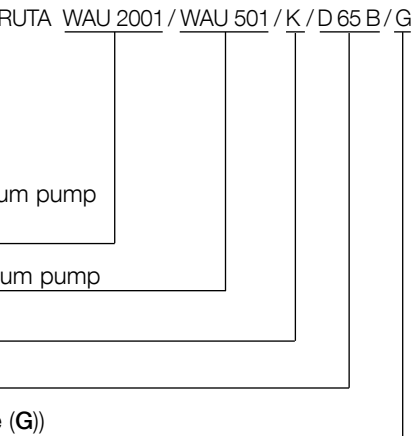

Brief designation of the smaller Roots vacuum pump

Cooler or condenser (if present)

Brief designation of the backing pump

Type of pump system (adaptor (A) or frame (G))

The pump system designation is arranged as follows:

Part Numbers

The part numbers listed refer in each case to the standard version of the respective systems. Minor deviations are indicated by way of variants. The variant V001 designates in each case the described version of the system.

The pump system RUTA WAU 2001/ SP630 F/G has Part No. 502 511 V001. When using the air-cooled screw pump SCREWLINE SP 630 then the variant will have the Part No. 502 511 V002. Minor deviations are special operating voltage, fitted accessories and custom painting for frame or pumps, for example. The use of a different type of Roots vacuum pump, use of the WS 2001 instead of the WAU 2001, for example, is also treated as a variant. All variants with the same basic number have the same frame dimensions, the same distance between intake flange of the Roots pump and the exhaust flange of the backing pump.

Types of Pump Systems

Typical areas of application for RUTA pump systems are industry, research and chemistry. Here the focus is on processes for metal production and processing, drying and degassing, thermal treatment, coating in the area of solar components and semiconductor manufacture as well as surface refinement. RUTA pump systems are also used as backing pump sets for high vacuum systems in combination with diffusion pumps, turbomolecular pumps and cryo pumps.

RUTA WH7000/4xSV750BF/G

The RUTA pump systems described here have been designed for rough and medium vacuum operation, i.e. for the pressure range from atmospheric pressure down to 10^{-4} mbar (0.75×10^{-4} Torr). RUTA pump systems consist of a combination of individual pumps whereby Roots vacuum pumps are employed on the intake side. Further compression to atmospheric pressure may be performed either by oil sealed or dry compressing vacuum pumps, liquid ring pumps or Roots vacuum pumps with pre-inlet cooling. All combinations may be equipped at suitable places with condensers.

The selection criteria for a RUTA pump system are as follows:

- Pumping speed
- Operating pressure
- Process conditions
- Characteristics of the media
- Standards and regulations which depend on the area of application and the produced products.

Standard RUTA Pump Systems

Our Roots vacuum pumps WA, WH, WS and RA or WAU and WSU with integrated bypass line are combined with oil sealed backing pumps for conventional generation of the vacuum. Single-stage arrangements are capable of delivering pumping speeds of 250 to 16000 m³/h (147.3 to 9424 cfm). Higher pumping speeds can be attained by paralleling several pumps. The attainable operating pressures depend on the number of pumping stages.

For higher pumping speeds or lower ultimate pressures, also three-stage or multi-stage pump systems are available.

RUTA Pump Systems with Condensers

If vacuum systems must pump larger quantities of vapor or vapor gas mixtures, it is economical to insert condensers which are cooled with water or a different coolant at a suitable place within the pump system. Cooled condensers are themselves effective partial pumps which condense most of the vapors from the pumped media. The downstream mechanical pumps will then only need to pump those gases which have not already condensed.

The quantity of vapor present in each case determines the size of the condenser and the temperature at which it is operated. The size of the downstream pump is determined by the quantity of non-condensable gases, the required pressure and the required pump-down time for the system.

All pump systems of the WA/WAU, WS/WSU, WH and RA series may be equipped with one or several condensers. These are often used in the chemical industry. Here RUTA vacuum pump systems with condensers are not only used to generate a vacuum, but they are also often employed in the recovery of solvents. When installing one or several Roots pumps upstream of a condenser, low operating pressures and high condensation pressures can be attained. Thus the condenser may in many cases be operated with cooling water instead of brine. The vapor components pumped together with inert gases may be separated once more in an emission condenser on the exhaust side so that the quality of the exhaust gas can be maintained within close tolerance regarding its cleanness.

Dry Compressing RUTA Vacuum Pump Systems

Increasing environmental awareness, pumping of condensable vapors or high requirements regarding cleanliness when pumping high quality media which must not be contaminated by other media for recycling, often requires the use of universal pumps where the pump chamber is free of operating agents (dry pumps).

Here Leybold offers two solutions:

1. Pump systems with dry compressing vacuum pumps combined with one or several Roots vacuum pumps.
2. Single-stage RUTA RAV vacuum pump systems, consisting of Roots vacuum pumps with pre-admission cooling.

The operating pressure ranges of the pump systems depend on the number of Roots vacuum pumps, but will extend in any case without interruptions to atmospheric pressure.

Already in connection with one Roots pump, pump systems with a screw pump are capable of attaining base pressures of $< 1 \times 10^{-3}$ mbar (7.5×10^{-4} Torr).

Single-stage RAV combinations attain an ultimate pressure of 150 mbar (112.5 Torr).

Multi-stage combinations with Roots vacuum pumps of all systems are capable of attaining pressures below 10^{-4} mbar (7.5×10^{-5} Torr).

RUTA Custom Pump Systems

Most users will be able to select the right pump system for their application from our range of standard pump systems. In special cases a custom design may be required for special processes and high pumping speeds.

We are prepared to design and manufacture custom pump systems according to customers specifications. If required we will use – besides oil-sealed and dry compressing backing pumps – liquid ring and ejector pumps.

RUTA Pump Systems for the Metal Producing and Processing Industry

In common vacuum furnace processes such as hardening, annealing, brazing, melting and casting, preferably oil sealed or dry compressing standard vacuum pump systems are usually used.

The oil sealed systems consist of a combination of Roots vacuum pumps with a single or two-stage rotary vane or rotary piston pump.

In the dry compressing systems our screw vacuum pump SCREWLINE is used as the backing pump.

The vacuum pumps are mounted in a rugged frame. The design of the pump systems is service-friendly, modular and can be easily upgraded with additional equipment.

On smaller furnaces RUVAC WAU Roots vacuum pumps are the most suitable because these may be cut-in at a higher operating pressure, while on larger furnaces and particularly where short pump-down cycles are required, the use of RUVAC WH Roots vacuum pumps with suitably sized backing pumps is advisable. For special processes, e.g. fusion or degassing of molten masses, due to the high dust contents, the additional use of a dust separator is required as well as equipping the backing pumps with oil filtering units.

These additional units ensure utmost operational reliability of the pump systems even under the toughest operating conditions.

Pump system for the field of steel degassing

RUTA Pump Systems for the Photovoltaic and Coating Industry

In photovoltaic coating processes reactive, toxic and corrosive substances are generally used.

Frequently large quantities of dust for the pump system need to be expected. For such applications, Leybold has developed process pump combinations consisting of pumps from the DRYVAC line and Roots pumps from the RUVAC WS/WH line with optionally integrated controller.

The integrated electronics and sensor systems permit easy integration of the pump systems within the plant control system.

(For information on possible applications, see Catalog Part "Dry Compressing Screw Vacuum Pumps DRYVAC").

RUTA Pump Systems for the Chemical Industry

In chemical processes it is often necessary to remove corrosive, condensable and reactive gases and vapors. Leybold designs and manufactures custom-built pump systems for specific process applications. Depending on the type of application, either a rotary vane pump, or a dry compressing screw vacuum pump (SCREWLINE, for example), a liquid ring pump or a combination of gas jet pump and liquid ring pump may be used as the backing pump.

To ensure dependable monitoring of the system, the following monitoring devices, among others, may be installed:

- Temperature sensors to monitor the gas temperatures between the pump stages and the pump body temperature,
- Water flow monitors for the cooling water supply to pumps and condensers,
- Differential pressure indicator with control setpoint to monitor the exhaust filters of the rotary vane vacuum pump.

Pump Systems for Drying, Evaporation and Distillation Applications (TVD)

More and more vacuum applications are finding their way into the areas of environmental protection, recycling and waste disposal. "Waste disposal of used oil and aromatic compounds" and "Cleaning processes in metal-processing factories" demonstrate that the combination of vacuum know-how, innovative engineering and applications know-how is indispensable for the successful application of vacuum technology in most widely differing applications.

TVD pump system, mobile with control cabinet

The product is no longer in the foreground, solutions to problems are demanded instead.

Leybold has developed some continuously operating vacuum pump systems for these applications. These systems basically consist of a rotary vane pump with a condenser unit. Upon request the condenser arrangement may also be equipped with a cold water set. This version will then be independent of any cooling water connections and - being a mobile system - it is well-suited for operation at varying locations.

Products

Oil Sealed RUTA Pump Systems – Three-Stage, with Two-Stage TRIVAC Backing Pumps, Adaptor Version

RUTA WAU501/D65B/A

Standard Equipment

- Exhaust filter
- Oil collecting pan
- Manually operated gas ballast
- Crane eyes on the frame
- Floor mounting
- The oil is supplied with the pump
- CE approval

Options

- Frequency converter RUVATRONIC RT for controlling the speed of the Roots pump
- Oil filter
- 24 V DC gas ballast valve
- Sound proofing box
- Vibration absorbers
- Castors
- Different types of floor mounts
- Oil drain valve on each pump
- Exhaust filter with oil return line
- Special motors
- Electric control systems

Oil Sealed RUTA Pump Systems – Three-Stage, with Two-Stage SOGEVAC NEO Backing Pumps, Adaptor Version

Standard Equipment

- RUVAC WAU with air cooling
- SOGEVAC SOGEVAC NEO 40 / 65 D with air cooling
- Exhaust filter with oil return
- Oil filter
- Oil collecting pan
- With manual gas ballast with three positions: closed, low flow and standard flow
- Crane eyes on the frame
- Floor mounting

- The oil is supplied with the pump

Options

- Frequency converter RUVATRONIC RT for controlling the speed of the Roots pump
- 24 V DC gas ballast valve
- Sound proofing box
- Vibration absorbers
- Castors

- Different floor mountings
- Oil drain tap on each pump
- Special motors
- Electric controls
- The SOGEVAC NEO pump can be equipped with a thermal oil level or exhaust filter overpressure switch

Oil Sealed RUTA Pump Systems – Two-Stage, with Single-Stage SOGEVAC Backing Pumps, Adaptor Version

RUTA WH4400/SV630BF/A

Standard Equipment

- RUVAC WH with water cooling
- Exhaust filter with oil return line
- Oil filter
- Oil collecting pan
- Gas ballast valve:
SV 100 to 300 manually operated
SV 630 BF 24 V DC
- SV 100 to 300 with air cooling
- SV 630 BF with water cooling
- Floor mounting
- The oil is supplied with the pump
- RUVAC WH including external frequency converter (frequency converter permits pumping speed control)
- CE approval

Options

- 24 V DC gas ballast valve or manually operated
- Sound proofing box
- Vibration absorbers
- Castors
- Different types of floor mounts
- Oil drain valve on each pump
- Special motors
- Electric control systems

Pump Systems (Only available for purchase in North and South America)

RBS – B/BCS Roots Pump Systems with Two-Stage TRIVAC Backing Pumps

RBS - B/BCS Roots pumping system, shown with optional AF exhaust filter

Standard Equipment

- System consists of TRIVAC dual-stage B or BCS direct drive vane pump and RUVAC blower
- Complete air-cooled system
- 18" wide frame base equipped with caster wheels and leveling pads
- Compact construction with quiet operation
- Manual operation of gas ballast
- Close-coupled RUVAC blower with ANSI inlet flange

Options

- All TRIVAC accessories, Exhaust filter, 24 V DC gas ballast valve, chemical oil filter, and electrical limit switch system
- Full frame drip pan
- Oil drain valves
- Special motor voltages and frequencies
- Special oil for unique applications
- Full electrical controls for control start/stop and monitoring of system

Oil Sealed Standard Vacuum Systems SOGEVAC

SOGEVAC Standard Vacuum Systems (SVS), configuration examples

Systems based on SOGEVAC rotary vane pumps in combination with Roots blowers from the RUVAC WA, WS or WH families are the industrial standard for all moderately demanding processes.

Vacuum systems based on oil-sealed SOGEVAC pumps deliver the best cost vs. performance ratio for a broad base of industrial applications.

Advantages to the User

- Fully modular system design with standard component combinations
- Smart combinations of SOGEVAC rotary vane pumps and RUVAC roots blowers
- Fast response times for quotations
- Shorter lead times compared to customized pump systems
- Well thought-out service concept
- Standard electrical cabinet with an identical operating concept
- Standard I/O interface
- Additional features like emergency stop switch "EMS"

Design

The two-stage SOGEVAC SYSTEMS consist of a combination of dry compressing Roots pumps and oil-sealed rotary vane pumps. The Roots pump installed on top of the backing pump serves as a booster for increasing the pumping speed in lower pressure ranges.

Various types of pumps may be used with SOGEVAC SYSTEMS:

Roots pumps

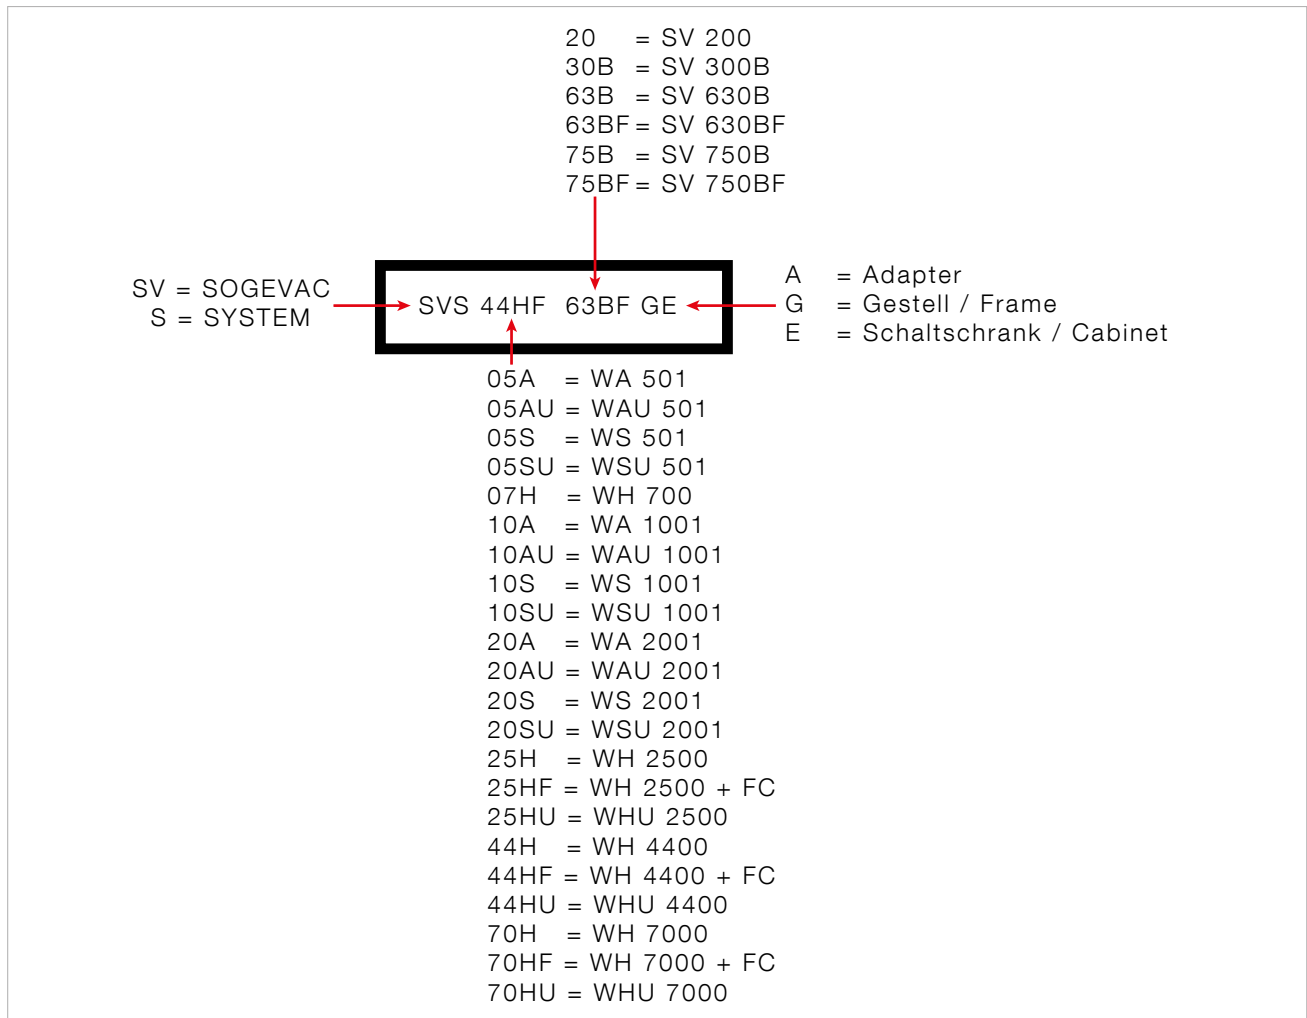

RUVAC WA / WAU
RUVAC WS / WSU
RUVAC WH / WHU

Backing pumps

SOGEVAC SV

All SOGEVAC SYSTEMS described hereinafter are delivered as basic versions. The basic version can be customized according to individual requirements with an electrical system control, gas ballast system, a shut-off valve, and / or an inlet filter.

The pumps are air- and/or water-cooled and will be delivered either with mineral (LVO 1x0) or synthetic oil (LVO 210).

Naming conventions for SOGEVAC SYSTEMS

Naming conventions

The product designations of SOGEVAC SYSTEMS are rather obvious and indicate directly which pumps were combined for a specific system:

- The first three letters „SVS“ stand for „SOGEVAC SYSTEM“
- The next (up to 4 alphanumeric) characters stand for the RUVAC version
- The following 4 characters stand for the SOGEVAC's pumping speed and version
- The last two characters give hints on the features of the pump system

Intake flange	DN 63 ISO-K			
Discharge flange	G2			

- Noise levels of > 100 dB(a) may occur with cyclic operation conditions, e.g. with load-lock operations or plain pump-downs. In this case we recommend to use RUVAC pumps with a pressure balance line („U“-pumps).
- The frequency converter standard ratings are valid for an installation altitude up to 1,000 m. If the altitude exceeds 1,000 m both the input voltage and the rated output current must be derated for 1% per 100 m.
- In case of overvoltage (> 480 V), bad cooling, and permanent operation at nominal power, the output power may be reduced in order to prevent thermal overload of the frequency converter. In case of undervoltage (< 380 V) the maximum power is not available by design.
- The minimum permissible frequency for the RUVAC is 20 Hz.
The minimum permissible speed is relevant for the oil lubrication of bearings and gears. Running the pump at less than the minimum speed for more than 1 hour can cause damage to the pump due to a lack of lubrication.
- bar(g): bar (gauge) is the overpressure, i.e. atmospheric pressure = 0 bar(g)
- Valid for operations at ult. pressure conditions. Higher speeds, especially pressures >10 mbar, generate higher noise levels.
- In the EU, the drive's energy efficiency is equal to IE3 during RUVAC operations with a frequency converter. During RUVAC WH operations w/o frequency converter the energy efficiency is equal to IE2.

- Noise levels of > 100 dB(a) may occur with cyclic operation conditions, e.g. with load-lock operations or plain pump-downs. In this case we recommend to use RUVAC pumps with a pressure balance line („U“-pumps).
- The frequency converter standard ratings are valid for an installation altitude up to 1,000 m. If the altitude exceeds 1,000 m both the input voltage and the rated output current must be derated for 1% per 100 m.
- In case of overvoltage (> 480 V), bad cooling, and permanent operation at nominal power, the output power may be reduced in order to prevent thermal overload of the frequency converter. In case of undervoltage (< 380 V) the maximum power is not available by design.
- The minimum permissible frequency for the RUVAC is 20 Hz.
The minimum permissible speed is relevant for the oil lubrication of bearings and gears. Running the pump at less than the minimum speed for more than 1 hour can cause damage to the pump due to a lack of lubrication.
- bar(g): bar (gauge) is the overpressure, i.e. atmospheric pressure = 0 bar(g)
- Valid for operations at ult. pressure conditions. Higher speeds, especially pressures >10 mbar, generate higher noise levels.
- In the EU, the drive's energy efficiency is equal to IE3 during RUVAC operations with a frequency converter. During RUVAC WH operations w/o frequency converter the energy efficiency is equal to IE2.

Central Vacuum Supply Systems with SOGEVAC Pumps

Central vacuum supply systems: CVS500 with 3 SOGEVAC SV 100 B, CVS 160 with 2 SOGEVAC SV 100 B, CVS 60 with 1 SOGEVAC SV 40 B

Central vacuum supply systems are frequently used in those cases where a large number of minor requirements for vacuum need to be economically covered. Moreover, the systems serve the purpose of compensating for large variations in the number of vacuum consumers and increase the availability of the vacuum service.

A typical central vacuum supply system from Leybold consists chiefly of one or more SOGEVAC rotary vane vacuum pumps, a buffer vessel, an electrical cabinet with controller as well as the corresponding connection components. The systems are supplied by us fully assembled, tested as plug and play units.

Standard Equipment

Typically consisting of

- up to 3 SOGEVAC pumps
- buffer vessel
- manual valve (basic control) or electropneumatic valve (PLC control)
- dust filter at the pump inlet
- pressure sensor
- two-stage pressure controller
- electrical cabinet with controller
- all connecting components

Advantages to the User

- Industrial grade vacuum generator consisting of proven SOGEVAC single-stage rotary vane vacuum pumps
- Covers the demands of numerous small vacuum consumers
- Modular design, customized to customer specific processes
- Simple to operate
- Space-saving system solution
- High return on investment, excellent price-to-performance ratio
- Energy saving capabilities
- Low cost of ownership
- Cycle time reduction due to the buffer volume
- Complete turn-key systems, ready for operation

Typical Applications

General applications demanding vacuum:

- Transportation
- Handling / lifting
- Degassing
- Automation (pick and place)

Automotive industry

- Thermoforming
- Break filling, degassing

Composites manufacturing

- Resin Transfer Moulding (RTM)

Vacuum pressing, like rubber, plastics, gaskets

Food packaging/food processing

- Vacuum filling
- Thermoforming
- Vacuum transportation, handling, lifting
- Tray sealing / MAP packaging
- Degassing

Hospitals/Medical engineering

- Bacteriological filters

Controller Types for the Central Vacuum Supply Systems from Leybold

Generally a difference is made between the controller types **BASIC** and **FF** (Full Featured).

Differing custom solutions are available upon request.

BASIC Controller

The Basic controller provides for two freely selectable switching thresholds, through which an individual vacuum pump or alternatively a blocking valve (optional) can be driven.

Moreover, the controller includes an electronic pressure display and an operating hours counter.

This type of controller is suited for systems equipped with a single pump up to a nominal pumping speed of 100 m³/h (58.9 cfm).

Basic control with one pump

Operating Principle of the BASIC Controller

Starting at atmospheric pressure, the central vacuum supply system is evacuated down to the intended "lower operating pressure" S_0 . As soon as the pressure has attained the level of S_0 , the vacuum pump is switched off automatically, respectively the optional blocking valve is closed.

When switching on the consumers, the pressure in the system rises again until the "upper operating pressure" is reached thereby tripping the switch-on threshold S_1 of the pump, respectively attaining the opening pressure of the valve.

Provided pumping speed of the pump and vacuum consumption are balanced, the operating pressure will change between S_0 and S_1 . At reduced consumption, the system pressure will reduce until the switching threshold S_0 is reached again causing the pump to switch off, respectively the valve to close etc.

FF Controller

Basically the FF controller provides for four freely selectable switching thresholds and has thus been designed to operate two pumps running in parallel. Depending on the design rating and current demand, the base load or master pump will operate alone or jointly together with the spare pump.

In order to spread the number of operating hours equally between the pumps, master pump and spare pump are interchanged in regular intervals. In case a pump fails, the controller effects an automatic change to the spare pump.

For operating vacuum pumps having a nominal pumping speed of over

100 m³/h (58.9 cfm), a delayed shut-down facility has been integrated which will restrict the number of switching cycles to 6 per hour.

Through the use of a Programmable Logic Controller (PLC), the FF controller permits flexible coverage of quite differing requirements.

FF controller with two pumps and an example for delayed shutdown (pumps over 100 m³/h (58.9 cfm))

Operating Principle of the FF Controller

Just as for the Basic controller, the system is, upon switching on, evacuated down to the lower operating pressure S0. This is effected with both pumps running in parallel (master pump and spare pump) until the shutdown threshold for the spare pump S2 is reached. Thereafter, the master pump alone will ensure that the lower operating pressure is reached and is then also switched off. When the system pressure increases due to the number of consumers or leaks to the level of S1, then the master pump will be switched on automatically etc.

In the case of vacuum pumps having a pumping speed of over 100 m³/h (58.9 cfm) and a running time of the pump of less than 10 minutes, then the standard switch off delay can be responsible for the pressure to drop below S0. This will prevent too frequent switching on and off of the pumps.

If for process reasons the pressure is not allowed to drop below the lower operating pressure, we recommend

the use of electropneumatic or solenoid blocking valves.

If the current vacuum demand cannot be met by the master pump alone, the system pressure will increase to the upper switching pressure S3 upon which the spare pump is automatically started.

With both pumps running in parallel, the system is then again evacuated until the switch off threshold S2 for the spare pump is reached again etc.

* 50 Hz

** At ultimate pressure without gas ballast, free-field measurement, distance 1 m

Beyond the equipment which is supplied as standard, the modular design of the central vacuum supply systems from Leybold allows for customization according to your specific requirements.

Optionally available are, for example:

- Higher pumping speeds and larger buffer volumes
- Electropneumatic or solenoid blocking valves
- Mobile construction on castors
- Other mains voltages
- Additional pumps, filters, fittings etc.

Central Vacuum Supply Systems

Central vacuum supply system, simplex

Central vacuum supply system, duplex

Central vacuum system, triplex

Standard Equipment

- ASME® rated receiver tank
- Flexible configurations for one, two, or three SOGEVAC pumps
- Manual isolation valves
- Simple operation, high reliability, easy maintenance
- Complete package with gauges and NEMA12 controls
- Standard “ON/OFF/AUTO” switch
- Elapsed time meters
- Inlet particulate filters
- Lead/Lag or continuous operation of pumps
- Adjustable pressure switch for control of vacuum level
- Air-cooled SOGEVAC pumps with built-in “anti-suckback” valves

Options

- Tank or stack mounted pumps
- Larger receiver tank
- Special inlet filters
- Automatic isolation valves
- Special design controls per customer specification

Tank Mounted Medical Vacuum Systems

**NFPA 99C compliant and designed for use in medical applications –
hospitals, out-patient surgical and other medical facilities**

Tank mounted medical vacuum system

Leybold tank mounted systems are completely assembled with interconnecting piping, are factory tested and leak-checked prior to shipment. Some items may be disassembled for protection during shipment. Required mechanical re-assembly requirements will be clearly noted, as well as needed electrical connections, and are the responsibility of the installer.

System Features

Key features for these duplex systems include two SOGEVAC series oil sealed rotary vane vacuum pumps with displacements up to 69 cfm each, an ultimate vacuum of better than 29.95" Hg, and automatic oil recirculation system with integral coalescing exhaust demisters as standard. ASME rated receiver tanks, NEMA12 / UL listed electrical enclosure and inter-connecting hardware. Each turn-key system is fully assembled and tested at Leybold Vacuum's factory and includes an operation manual and 12 month warranty.

Other System Features

Vacuum pumps and systems:

- Direct-coupled TEFC, IP 55 rated motors
- Integral gas ballast
- Anti suck back valve
- Air-cooled design
- NPT type inlet and exhaust connections
- Inlet protection
 - particulate filters rated for 10 micron retention
 - Isolation ball valves
 - Pump check valves
- Vacuum gauge, 0 – 30" Hg
- Vertical receiver, ASME coded, manual drain valve and tank bypass

Local duplex motor control center:

- 2x magnetic motor starters with overload protection
- Main fused disconnect switch
- 2x through the door disconnect switches
- 2x individual control transformers
- 2x elapsed time meters
- 2x hand-off-auto switches
- Lag pump audible alarm with indicator light
- Automatic alternation
 - Lead / Lag operation
- 2x dual set-point vacuum switches
- Emergency stop
- NEMA12, UL listed enclosure
- System wired for either 208/230/460 V, 3 phase, 60 Hz operation

Dry Compressing Vacuum Pump System RUTA with SCREWLINE Backing Pump, Adaptor Version, without palette

RUTA WAU2001/SP630/A

Standard Equipment

- RUVAC WAU with air cooling
- RUVAC WH with water cooling
- Silencer
- SP-GUARD
- Manually operated gas ballast
- Gear oil collecting pan integrated within the screw pump
- Gear oil supplied with the pump
- Screw pump SCREWLINE SP 630 F with water cooling

- Screw pump SCREWLINE SP 250 with air cooling
- RUVAC WH including external frequency converter (frequency converter permits pumping speed control)
- CE approval

Options

- Frequency converter for controlling the speed of the Roots pump (only RUVAC WA/WS)
- Condensate drain valve at the silencer
- Sound proofing box
- Vibration absorbers
- Castors
- Different types of floor mounts
- Oil drain valve on each pump
- Electric control systems
- Non-return valve
- Screw pump SCREWLINE SP 630 with air cooling

Dry Compressing Vacuum Pump System RUTA with SCREWLINE Backing Pump, Adaptor Version, with palette

RUTA WAU2001/SP630/A

Standard Equipment

- RUVAC WAU with air cooling
- Silencer
- SP-GUARD
- Manually operated gas ballast
- Gear oil collecting pan integrated within the screw pump
- Gear oil supplied with the pump
- Screw pump SCREWLINE SP 630 F with water cooling

- Screw pump SCREWLINE SP 250 with air cooling
- CE approval

Options

- Condensate drain valve at the silencer
- Sound proofing box
- Vibration absorbers

- Castors
- Different types of floor mounts
- Oil drain valve on each pump
- Electric control systems
- Non-return valve
- Screw pump SCREWLINE SP 630 with air cooling

Pump Systems (Only available for purchase in North and South America)

SP Close-Coupled Systems with SP Dry Compressing Backing Pumps

SP close-coupled system

Advantages to the User

- Reduced maintenance and lower operating costs
- Compact close-coupled design without frame
- Oil-free compression in multiple pump stages
- Optimum leak tightness with WSU boosters
- Air-cooled
- Assembled and tested

Standard Equipment

- SCREWLINE SP 630 / WSU 1001 close-coupled pump system offering 645 ACFM at 0.3 Torr vacuum
- SCREWLINE SP 630 / WSU2001 close-coupled pump system offering 1235 ACFM at 0.3 Torr vacuum

Options

- Electrical controls
- Exhaust silencer (loose)
- Inlet filter (loose)

The screw pump SCREWLINE SP 630 dry compressing screw-type vacuum pump is an environmentally friendly alternative to traditional oil sealed rotary piston and vane vacuum pumps. This innovative and robust vacuum pump produces a pumping speed of 371 cfm and better than 0.0075 Torr vacuum. SP 630 major advantages include improved environment, reduced maintenance, lower operating costs through less disposal and the elimination of expensive water cooling all with no oil contamination as the need for lubricating oil in the pumps' compression stage has been eliminated.

When used in conjunction with the Leybold WSU booster pumps, pumping speeds can be significantly increased while achieving oil-free compression in multiple vacuum pump stages.

Leybold WSU boosters offer a canned motor design, which eliminates the need for shaft seals and flanged-on motors. A vacuum tight can separates the motor rotor and stator coils. This unique Leybold design provides the advantage of a more leak tight vacuum system. The WSU version booster incorporates a by-pass valve feature, which allows for automatic adjustment to varying pressure differentials between the inlet and outlet of the pump. The result is elimination of costly pressure switches/ amplifiers and faster pump down while starting at atmospheric pressure with the aforementioned SP 630 vacuum pump.

Dry Compressing Vacuum Pump System RUTA with DRYVAC DV 200 / DV 300 Backing Pump, Adaptor Version

RUTA WSU1001/DV300/A

Standard Equipment

- RUVAC WSU or RUVAC WH and DRYVAC
- DRYVAC DV 200 or DV 300 with built-in frequency converter and indirect water cooling
- Hermetically sealed
- Integrated vacuum-side valve 24C DC for supplying purge gas to the shaft seal of the DV 200 / DV 300
- 24V DC controlled gas ballast
- Integrated bypass valve for fast pump down
- Integrated temperature sensors
- All DRYVAC models are compatible with numerous field bus protocols
- The integrated frequency converter together with three sensors monitors all electrical, thermal and mechanical components. The sensors determine the exhaust gas pressure, the engine temperature and the water outlet temperature and trigger an alarm if necessary
- All DRYVAC models offer serial I/O connections including an RS485 interface
- Profibus, Ethernet/IP, ProfiNet and EtherCAT are optionally available
- RUVAC with integrated bypass valve for fast pump down
- The pump system provides a very low noise level

Dry Compressing Vacuum Pump System RUTA with DRYVAC DV 650 Backing Pump, Adaptor Version

RUTA WH4400/DV650/A

Standard Equipment

- RUVAC WH and DRYVAC with water cooling
- DRYVAC DV with built-in frequency converter
- DRYVAC DV-r including external frequency converter
- RUVAC WH including external frequency converter (frequency converter permits pumping speed control)
- Hermetically sealed
- Integrated protection functions (discharge pressure, temperatures and current consumption)

- Innovative motor design with efficiency class IE2
- Gas ballast with manual valve
- Leak detection port
- Lubricant: synthetic oil (LVO 210)

Options

- Exhaust silencer
- Bus interface
- Non-return valve for DRYVAC

- Seal gas connection
- Gear chamber evacuation RUVAC WH
- Frequency converter for RUVAC pump
- Electrical controller
- Oil drain tap
- Cooling water monitoring
- Quick couplings for water connections, blocking on both sides
- Frame

Dry Compressing Pump Systems DRYVAC

DRYVAC SYSTEM: Basic System Configuration (left), Smart System Configuration (middle), PowerBoost (right)

Leybold has refined its DRYVAC vacuum pump systems, making them adaptable for a variety of applications — The recipe is simple and efficient: Take a dry compressing screw vacuum pump and a roots pump, combine both of the proven technologies along with pressure measurement, shut-off devices and electrical control, creating a turn-key smart vacuum system that is cost-effective and completely ready for use by the customer.

For more than five years, the fore vacuum systems of the DRYVAC pump series by Leybold are already being used successfully in various processes, which can be simple or very challenging. The pumping systems are known for their maximum suction capacity while operating at minimum operating costs.

Now, Leybold has developed the systems further: The new two-stage DRYVAC systems distinguish themselves particularly by their modular

design and the resulting improved user friendliness and easy servicing. All equipment features are aligned to the requirements of the different markets.

Advantage to the User

- Extremely compact design provides more space in production areas
- Very low noise level improves working environment conditions
- Significant cost reduction because of high energy efficiency
- Clean technology with no oil emissions
- Optimized for fast cycle / load lock applications
- Fastest pump down times – by high throughput pump mechanisms
- Highest pumping speed for dry and booster pumps
- Pumping speed from 2,000 m³/h up to 9,800 m³/h
- Integrated smart monitoring of major parameters
- Standard Digital I/O interface and Profibus (optional) for the whole product family
- Platform based product design proven in a huge installed base
- Tolerance to misuse
- Optimized design and screw profile
- Lowest power consumption
- Low cost of ownership
- minimized foot print

Typical Applications

- Glas Coating
- Crystal Pulling
- Sputtering / Decorative Layers
- Furnaces
- Protective Coating
- Battery
- Solar
- Display

Basic System Configuration

Pre-assembled vacuum pump systems (basic version). Monitoring, control, programming, and power electronic components to be provided by the customer.

Standard Configuration:

- exhaust to the side
- triple purge gas module

Optional Configurations:

Double purge gas module, gas ballast system, non-return valve, quick-access couplings (water), mating connector for power & signal supply, relay board (digital I/O)

Advantages

- high performance with excellent cost-performance ratio
- worldwide service & spare parts availability
- rapid response times

Smart System Configuration

The smart pump system versions are characterized by integrated power electronics, monitoring devices for the purge gas system and key parameters, easy and user-friendly operation handling (local / remote), and additional features, e.g. connecting a gauge head.

Standard Configuration:

- digital I/O interface
- prepared for connecting a variety of different gauge heads (CTR, DU, TTR)
- Emergency Stop (EMS)
- compensation for voltage drops ($\leq 2s$)
- triple purge gas module
- exhaust to the side

Optional Configurations:

Double purge gas module, gas ballast system, non-return valve, quick-action couplings, Profibus, Ethernet or Profinet interfaces.

Advantages

- high performance at attractive prices
- autonomous vacuum pump system
- worldwide service & spare parts availability
- rapid response times

Dry Compressing Pump Systems DRYVAC Basic System Configuration

The two-stage DRYVAC SYSTEMS consist of a combination of dry compressing Roots pumps and screw pumps. The Roots pump installed on top of the backing pump serves as a booster for increasing the pumping speed.

Various types of pumps may be used with DRYVAC SYSTEMS:

Roots Pumps

RUVAC WA
RUVAC WAU
RUVAC WH
RUVAC WHU
RUVAC WS
RUVAC WSU

Backing Pumps

DRYVAC DV S
DRYVAC DV C

All DRYVAC SYSTEMS (b versions) described hereinafter are delivered as basic versions. The basic version can be customized according to individual requirements with accessories (e.g. Harting plug or gas ballast system).

The pumps are water-cooled and lubricated either with synthetic oil or PFPE.

Additional information regarding the technical data

- Noise levels of > 100 dB(a) may occur with cyclic operation conditions, e.g. with load-lock operations or plain pump-downs. In this case we recommend to use RUVAC pumps with a pressure balance line („U“-pumps).
- The frequency converter standard ratings are valid for an installation altitude up to 1000 m. If the altitude exceeds 1000 m both the input voltage and the rated output current must be derated for 1% per 100 m.
- In case of overvoltage (> 480 V), bad cooling and permanent operation at nominal power the output power may be reduced in order to prevent thermal overload of the frequency converter. In case of undervoltage (< 380 V) the maximum power is not available by design.
- The minimum permissible frequency is 20 Hz for both the DRYVAC and the RUVAC.
The minimum permissible speed is relevant for the oil lubrication of bearings and gears. Running the pump at less than the minimum speed for more than 1 hour can cause damage to the pump due to a lack of lubrication.
- bar(g): bar (gauge) is the overpressure, i.e. atmospheric pressure = 0 bar(g)
- Valid for 50Hz operations at ult. pressure conditions. Higher speeds, especially pressures >10 mbar, generate higher noise levels.

* auf Anfrage; wenden Sie sich an Leybold Köln / upon request; pls. contact Leybold Cologne

** Hinweis: wenden Sie sich an Leybold für den FW-Einsatz mit RUVAC WA & WS / Note: pls. contact Leybold for operating RUVAC WA & WS + VFD

*** für Kupplungsgegenstände wenden Sie sich an Leybold Köln / for counter couplings pls. contact Leybold Cologne

Dry Compressing Pump Systems DRYVAC Smart System Configuration

The two-stage DRYVAC SYSTEMS consist of a combination of dry compressing Roots pumps and screw pumps. The Roots pump installed on top of the backing pump serves as a booster for increasing the pumping speed.

Various types of pumps may be used with DRYVAC SYSTEMS:

Roots Pumps

RUVAC WA
RUVAC WAU
RUVAC WH
RUVAC WHU
RUVAC WS
RUVAC WSU

Backing Pumps

DRYVAC DV S
DRYVAC DV C

All DRYVAC SYSTEMS (i versions) described hereinafter are equipped with:

- Microcontroller with touchscreen
- Connectivity options for gauge heads
- Harting connections (power supply)
- Digital I/O communication interface (DC37-P)
- Housing, castors and adjustable feet

They are water-cooled and lubricated either with synthetic oil or PFPE.

Additional information regarding the technical data

- Noise levels of > 100 dB(a) may occur with cyclic operation conditions, e.g. with load-lock operations or plain pump-downs, In this case we recommend to use RUVAC pumps with a pressure balance line („U"-pumps).
- The frequency converter standard ratings are valid for an installation altitude up to 1000 m. If the altitude exceeds 1000 m both the input voltage and the rated output current must be derated for 1% per 100 m.
- In case of overvoltage (> 480 V), bad cooling and permanent operation at nominal power the output power may be reduced in order to prevent thermal overload of the frequency converter. In case of undervoltage (< 380 V) the maximum power is not available by design.
- The minimum permissible frequency is 20 Hz for both the DRYVAC and the RUVAC.
The minimum permissible speed is relevant for the oil lubrication of bearings and gears. Running the pump at less than the minimum speed for more than 1 hour can cause damage to the pump due to a lack of lubrication.
- bar(g): bar (gauge) is the overpressure, i.e. atmospheric pressure = 0 bar(g)
- Valid for 50Hz operations at ult. pressure conditions. Higher speeds, especially pressures >10 mbar, generate higher noise levels.

Dry Compressing Pump Systems DRYVAC PowerBoost

The DRYVAC SYSTEM 44HUF65S IV (DS 4465-U2) consists of a combination of a dry compressing screw pump and a Roots pump. Its design has been specifically optimized for a fast load lock pump-downs, it is equipped with an automatic cycle detection system, and the Roots pump shows a special speed management. Thus, with an optimum utilization of the power, the mechanical stress due to pressure bursts was minimized, and the noise level during pump-downs was significantly reduced.

Furthermore the system described hereinafter is equipped with:

- integrated frequency converters
- Microcontroller with touchscreen
- digital I/O communication interface (DC37-P)
- Harting connections (power supply)
- housing, castors and adjustable feet

The system is water-cooled and lubricated with synthetic oil.

Technical Data

DRYVAC SYSTEM DS 44HUF65S iV

Ultimate total pressure w/o purge gas or with purge gas for shaft seal outlet ($\pm 10\%$)	$< 5 \times 10^{-3}$ mbar
Maximum permissible inlet pressure	1050 mbar
Maximum permissible discharge pressure (relative to ambient)	+200 mbar
Integral leak rate	$< 1 \times 10^{-4}$ mbar x l/s
Permissible gas inlet temperature	+5 ... +40 °C
Permissible ambient temperature	+5 ... +30 °C
Storage temperature	-10 ... +60 °C
Noise level with rigid exhaust pipe, at ultimate pressure (acc. to DIN EN ISO 2151)	Screw = 65 dB(A) Roots = 63 dB(A) ⁵⁾ ($K_{pA} = 3$ dB)
Relative atmospheric humidity	95 %, non-condensing
Installation location	up to 1000 m (NHN) ¹⁾
Cooling	Water
Mains voltage	360 – 440 V 50/60 Hz ²⁾
Frequency ($\pm 5\%$)	50 / 60 Hz
Phasen	3-ph
Rated power at 400 V ($\pm 0,8$ kW)	57 kW
Rated current at 400 V	95 A
Power consumption at ultimate pressure ($\pm 0,8$ kW)	9 kW
Motor efficiency class, calculated and configured acc. to EN 60034-30	IE2
Min. permissible speed ³⁾	1200 rpm
Protection class	IP20
Lubricant filling	LVO 210
Total lubricant quantity ($\pm 5\%$)	5.7 l
Intake flange	DN 250 ISO-K
Discharge flange	DN 63 ISO-K
Materials (components in contact with gas in the pump chamber)	Grey cast iron /graphite cast iron / steel/stainless steel /epoxy paint / FKM
Materials sealing the pump off in the pump chamber towards the outside	FKM, grey cast iron
Weight, approx. (± 40 kg)	1500 kg
Dimensions (L x W x H) (± 10 mm)	1704 x 677 x 1140 mm
Water	
Water connection	G1/2" (female)
Water temperature	5 – 35 °C
Minimum supply pressure (unobstructed discharge, no backpressure)	2 bar(g) ⁴⁾
Maximum supply pressure	7 bar(g) ⁴⁾
Nominal flow	14 l/min

Technical Data

DRYVAC SYSTEM DS 44HUF65S iV

Purge gas	
Connection	G1/4" (female)
Nominal setting pressure "Purge gas" (at nominal flow, valves open)	2.8 bar(g) ⁴⁾
Permissible setting pressure "Purge gas" (at purge gas flow)	2.8 to 4.5 bar(g) ⁴⁾
Permissible supply pressure "Purge gas"	4.0 to 10.0 bar(g) ⁴⁾
Purge gas flow shaft seal inlet (d = 2.0 mm) / outlet (d = 0.9 mm) at nominal setting pressure (2.8 bar(g)) at max. setting pressure (3.5 bar(g))	92 slm / 22 slm 107 slm / 26 slm

Additional information regarding the technical data

- 1) The frequency converter standard ratings are valid for an installation altitude up to 1000 m. If the altitude exceeds 1000 m both the input voltage and the rated output current must be derated for 1% per 100 m.
- 2) In case of undervoltage (< 380 V) the maximum power is not available by design.
- 3) The minimum permissible frequency is 20 Hz for both the DRYVAC and the RUVAC.
The minimum permissible speed is relevant for the oil lubrication of bearings and gears. Running the pump at less than the minimum speed for more than 1 hour can cause damage to the pump due to a lack of lubrication.
- 4) bar(g): bar (gauge) is the overpressure, i.e. atmospheric pressure = 0 bar(g)
- 5) The noise level is significantly higher due to flow generated noises during load lock operations. Its accurate value depends on the operational mode used as well as the intake line's design. The pump system DS 44HUF65S iV is equipped with an automatic cycle detection system. With detecting vacuum cycles the pump system will reduce the noise level to a minimum during pump-downs.

RUVAC RAV Roots Vacuum Pumps with Pre-Admission Cooling

Typical Applications

- Short pump-down cycles on large volumes
- Oil-free compression of high volume flows of gases and vapors against atmospheric pressure
- Single-stage (G) or in combination with RAV F as backing pump
- Operating pressures in the rough vacuum range
- CE approval

Advantages to the User

- **RUVAC RAV G**
Operating pressure range of 150 mbar (112.5 Torr) against atmospheric pressure; total leak rate $< 10^{-1}$ mbar x l/s (7.5×10^{-2} Torr x l/s)
- **RUVAC RAV F**
In combination with backing pumps the attainable operating pressures extend down into the medium vacuum range;
- leak rate $< 10^{-2}$ mbar x l/s (7.5×10^{-3} Torr x l/s)
- When series-connected the operating pressures extend down into the medium vacuum range:
 - two-stages to 25 mbar (18.75 Torr)
 - multiple stage to 10^{-3} mbar (7.5×10^{-4} Torr)
- Motors for special supply voltages and frequencies or protected types are available
- Pre-admission silencer and filter for the cooling gas inlet as well as silencers for the exhaust side (option/single-stage)
- Downstream gas cooler (option/multistage)
- C version (chemical version/option)
- Special materials (option)
- Pressure burst resistant version (option)

TVD Pump Systems for Drying, Evaporation and Distillation Applications

TVD 200

Advantages to the User

- Operating agent may be reused, for example by returning cleaned water to the process
- Reduction of the quantities which need to be disposed of by 80%
- Low temperature distillation/drying
- Condensate may be drained during vacuum operation
- CE approval

Typical Applications

- Drying of powders and solids, for example
- Cleaning of waste water
- Vacuum distillation

Standard Equipment

- Condenser at the intake side
- Receiver with condensate level indicator
- Manually operated valves on the receiver
- SOGEVAC rotary vane vacuum pump with integrated exhaust filters, anti-suckback valve and gas ballast valve

Dimensional drawing for the TVD pump systems

Options

- Valve between condenser and rotary vane vacuum pump
- Pressure gauge for checking the condensate pressure
- Solenoid valves at the receiver
- Receiver with proximity switch for monitoring the condensate level
- Electric control for automatic operation of the pump system
- Mobile pallet with castors
- Cold water replacement for mobile applications

¹⁾ Operating at ultimate pressure with gas ballast

Accessories for oil sealed and dry compressing Pump Systems

Sound Proofing

A sound proofing box is available as an optional extra so as to reduce the noise down to the permissible level.

Depending on the size of the pumping system, noise reductions between 15 and 20 dB(A) are obtained using our standard sound proofing arrangements.

Custom designs of the sound proofing box allow the noise level to be reduced by up to 35 dB(A).

RUTA RA 3001/S630F/G with sound proofing box

The maintenance side is designed as a door component. A window insert may be provided in the door or in the side walls to facilitate checking of the oil levels.

Ventilation is performed by means of an electric fan, the fresh air and exhaust ducts are located within the sound proofing box. Further optional extras which may be fitted include closed air circulation with integrated, water-cooled heat exchanger and a connection port for a central exhaust system.

Isolation against Vibrations

RUTA vacuum pump systems produce only slight vibrations. To reduce these vibrations even further, vibration absorbers can be fitted under the pump system.

Dust Separators

Vacuum processes where large amounts of particles or dusts are contributed by the process require special devices to protect the vacuum pumps.

Leybold has developed – even for high flow rate applications – special dust separators, which can be installed ahead of the intake of the RUTA vacuum pump systems. The dust separators have two stages. The first stage is a cyclone that collects dust particles of coarse and medium size, the fine dust are trapped in filter elements. Dust separators are customdesigned for the specific process and the required pumping speed.

Dust Filter without Cyclone

See further down in this chapter.

Diagrammatic section through a dust separator

without dust load							

Frequency converter RUVATRONIC RT 5

The electronic frequency inverters RUVATRONIC RT 5/251 to 5/16000 have been designed specially for use in connection with Leybold Roots pumps of the RUVAC type. For each Roots vacuum pump size, a matching frequency converter is available.

The main characteristics of the RUVATRONIC RT 5 are:

Simulation of a pressure equaliza- tion line

The software of the frequency inverters is adapted to each pump and ensures that the risk of mechanically overloading the pump can be excluded. In the case of too high pressure differences, the rotational speed will be decreased

automatically until the load is reduced to within the pump's limits.

RUVAC Roots vacuum pumps of the types WA, WS and RA (without pressure equalization line) can be switched on together with the forepump at atmospheric pressure. Through this, the pumpdown time can be reduced drastically. The minimum pumping speed of the backing pump needs to be considered in this case.

Pump	Required pumping speed for the backing pump
WA/WS 251	50 m ³ /h (29 cfm)
WA/WS 501	100 m ³ /h (59 cfm)
WA/WS 1001	200 m ³ /h (118 cfm)
WA/WS 2001	410 m ³ /h (241 cfm)
RA 3001	650 m ³ /h (383 cfm)
RA 5001	930 m ³ /h (547 cfm)
RA 7001	1250 m ³ /h (736 cfm)
RA 9001	3240 m ³ /h (1907 cfm)

Operation at up to 3 predefined speeds

Via floating contacts, the pump can be operated at one of the 3 predefined speeds. Switching over to another pre-defined speed is possible during operation.

Operation at any rotational speed

With a 0 to 10 V signal, any speed can be pre-defined to operate the pump between the minimum and maximum rotational speed. The software reliably ensures that the rotational speed cannot drop below the minimum speed or exceed the maximum speed.

Increase in the pumping speed

By operating the Roots vacuum pumps at frequencies over 50 Hz, the nominal pumping speed of the pumps can be increased. Depending on the type of pump, an increase between 20 and 100% is possible.

Note

Please enquire about possible application limitations (process dependent).

Electric Controller

In order to drive all electrical appliances within the pump systems, the pump systems may be equipped with standard control cabinets which contain:

- Motor protection switch (rated for the pumps used in each case)
- Contactors
- Main switch interlocked in accordance with VDE 0113
- Relays for necessary control/sub-systems
- ON/OFF push-button for each pump
- Power supply for the installed monitoring facilities
- Fault indicators arranged on a lamp panel
- Switch-over (through an external contact) from local to remote operation.

The control cabinet may be fitted either to the frame of the pump system or it may be wallmounted.

Beside the standard systems, we manufacture control systems for much more complex systems:

- Remote control module as a 19" rack module (1/4 width, 3 HU). The start/stop push-buttons and the related indicators for operation and fault are located on the front panel
- Pre- and post-operation control
- Pressure dependent control
- Time-dependent control
- Program control
- Control for explosion hazard areas
- Combinations of the aforementioned versions
- Programmable control (PC)
- Vacuum gauge with pressure read-out in the control cabinet.

Pressure Control

Basically there are several ways in which to control the pressure.

The equipment which is supplied as standard for the **DOWNSTREAM** or **BYPASS** control systems selected by Leybold consists of:

- Pressure measurement
- Controller with control unit
- Control valve with position indicator
- Engineering.

The **Downstream Control System** throttles the pumping speed of the vacuum pump by changing the conductance of the valve.

The advantages offered by this arrangement are:

- No supply of other gases
- Closed system
- The intake pressure of the pump system is lower than its operating pressure (thus saving energy, among other things).

The second method is the **Bypass Control System**. Here the pressure is maintained at a constant level by admitting an additional quantity of gas.

The advantages offered by this arrangement are:

- Simple design
- Much smaller valve
- No reduction of the intermediate pressure within the pump.

In order to design a pressure control system we need the following information:

- Amount of gas
- Type of gas
- Pressure
- Length of the piping
- Type of auxiliary energy (electric/pneumatic)
- Explosion protection required yes/no.

Additional complex control arrangements are available, for example with:

- Adjustable pressure characteristic
- Adjustable timing
- Speed control
- Combination with other control facilities.

Control panel on RUTA WAU1001/SV200/G

Dust Filter F-xxx-C

The highly efficient dust filters F-xxx-C are fitted to the inlet of the RUVAC pumps. The filter protects the Roots vacuum pumps against the intake of dust.

The dust filters are equipped with an easy to replace filter element. In the case of the filters F-1001-C or larger, the gas enters into the housing above the filter element. Thus the likelihood of puncturing the filter is reduced.

In the case of the dust filter F-501-C, the filter element is protected by a baffle.

All vacuum dust filters are rated for pressures up to 1200 mbar (900 Torr) abs. max.

Bus Interfaces for Monitoring

Wi-Fi and Profibus interface kit for SP-GUARD

Bus interfaces for remote reading of the SP-GUARD monitoring system for the screw pumps SCREWLINE SP 250 and SP 630. Item can be ordered as retrofit kit or together with the pump unit.

Advantages to the User

- Interface box for assembly on screw pump SCREWLINE SP 250 and SP 630
- Read out of vibration levels, oil temperatures, warning and failure functions
- The interface box is mounted next to the SP-GUARD
- Interface box needs a 24 V DC supply on-site (24 V DC supply of the SP-GUARD can be used)

Available Interfaces

- Profibus
- Wi-Fi

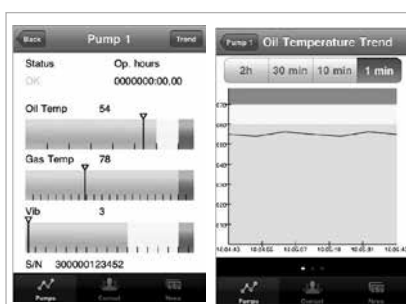

Further interfaces upon request:

- Profinet
- DeviceNet
- Ethernet
- CAN bus
- Interbus
- etc.

MAKE USE OF OUR KNOW-HOW !

Simply fax the completed checklist to us. Our engineers will design a pump system which exactly matches your requirements. You will receive an offer shortly.

1. In what kind of application will the pump system be used (e.g. drying, distillation)?

2. Is the process run
☐ continuously ☐ in batches:

3. What is the volume of the vacuum chamber?

_____ m³

4. What pump-down times are required/desired?

_____ min³ x h⁻¹

5. What operating pressures are planned?

_____ mbar

6. How high is the ambient temperature?

- when installed in the building:

min. _____ °C / max. _____ °C

- when installed out in the open

min. _____ °C / max. _____ °C

7. How high is the intake temperature?

_____ °C

8. What is the composition of the gas which is to be pumped.

Designation:

a) _____ b) _____

c) _____ d) _____

e) _____ f) _____

9. Quantity (kg/h or Nm³/h), traces (%):

a) _____ b) _____

c) _____ d) _____

e) _____ f) _____

10. In case of materials not commonly listed in the tables please state:

a) Molecular mass _____

b) Thermal capacity _____

c) Vapor pressure _____

d) Viscosity _____

e) Melting point _____

f) Special characteristics _____

11. Must explosion hazard regulations be observed?

☐ yes ☐ no

if yes, which? _____

12. What kind of electrical supplies are available?

a) Voltage _____

b) Frequency _____

13. What kind of mechanical connection specifications are planned?

a) Length of the intake line

b) Diameter of the intake line

14. Which cooling media are available (water, brine, etc.)? Which temperature?

_____ min. _____ °C

_____ max. _____ °C

General to High Vacuum Pump Systems TMP

The requirements of production or research engineers concerning the vacuum technology they have to employ are usually widely different. In most cases pumping speed and operating pressure must be accurately matched to suit a particular process. The wide range of vacuum pumps and standard accessories available offers many options.

Sometimes it is just this flexibility which causes difficulties when having to decide between the various configurations of a particular pump system. Based on our experience and by listening to our customers' demands, we have therefore compiled a range of turn-key vacuum systems based on standard components.

Before leaving the factory they are subjected to both functional tests and leak tests. By adding components from our standard range or special of accessories they may be easily adapted to meet specific requirements.

Turbomolecular Pump Systems

TURBOLAB 90 i, 250 i, 350 i, 450 i

Turbomolecular pump system TURBOLAB 350 i (top left), TURBOLAB 90 i (down left) and TURBOLAB 350 i Cart (right)

This new smart TURBOLAB generation is built on one basic design platform with the opportunity to create two different variants (Tabletop or Cart-System).

Each version can be customized to individual needs regarding add-ons like vacuum measurement devices, a choice of accessories, e.g. valves and heaters.

Basic Equipment

Turbomolecular pump

TURBOVAC i models from 90 l/s to 450 l/s including frequency converter

Backing pump

Dry or oil-sealed, 1 m³/h - 20 m³/h, 24 V DC/110-230 V

Backlight display

Every TURBOLAB comes with the Turbo Pressure Unit TPU for control, configuration and monitoring of the pump system

Built-in support for accessories

- Purge
- Vent
- Air or water cooling unit
- Flange heaters
- Two pressure gauges (1000 mbar to 1 x 10⁻⁹ mbar)
- Foreline safety valve

Built-in webserver

- Condition monitoring
- Data analysis
- Software updates

- Control, monitor and configure your TURBOLAB system

Easily relocate pump

away from the frame and on your chamber

Remote control via the X1 Interface

- Configurable X1 Digital/Analog I/O
- Start/Stop
- Error
- Warning
- Analog Output

Advantage to the User

- Enhanced pump performance
- Compact mobile design
- Small foot print
- Easy to relocate pumps out and

away from the frame

- Backlight display (control/monitoring/configuration)
- Monitored data like frequency, temperature, current, pressure are automatically stored to a data log file in the TURBOLAB. Users easily view the log file with the TURBOLAB data viewer software tool which can be downloaded for free from the Leybold website or the last 512 data points can be viewed from the TURBOLAB data viewer in the web server
- Covering more applications with a full range of high vacuum and dry or wet forevacuum pumps to cover more high vacuum applications
- Benchmark turbostation offering dedicated ports for the connection of
 - six different accessories
 - two gauges
- Benchmark functionality, reliability and design
- Prepared for worldwide voltage coverage
- Price-to-performance ratio

Typical Applications

- Analytical Instruments
- Spectroscopy
- Tube manufacturing
- Beam guidance systems
- Micro balances
- Sputtering and evaporation systems
- Surface physics
- Laboratory pump systems

Options

- Alternatively ISO-K or CF connection
- The Cart version comprises a base-plate, mounting column, castors or a benchtop frame with rubber feet
- Relocation kits available to relocate the pumps away from the frame and onto your chamber

The pump system can be upgraded with further components:

- Vacuum gauges: TTR 91 (N), TTR 101 (N), PTR 91 (N). Simultaneous operation of two gauges is possible
- Adsorption trap
- Exhaust filter
- Air cooling unit
- Water cooling unit
- Flange heater
- Venting valve
- Purge gas valve
- Foreline venting valve
- Vacuum safety valve SECUVAC DN 15/25/40 ISO-KF

Scope of delivery

- Transport lock at the high vacuum flange by way of a Plexiglas disc
- Covering caps for the threads of the transport lock
- Exhaust side: centering ring and clamping ring
- Documentation
- The TRIVAC and SOGEVAC are filled with LVO oil

Accessories for High Vacuum Pump Systems TMP

Adsorption Traps with Aluminium Oxide Insert

Adsorption trap (left) and insert (right)

Adsorption traps are installed in all those cases where an oil-free vacuum is to be produced with oil-sealed vacuum pumps.

Advantages to the User

- Backstreaming of oil is reduced by 99%
- Long service life
- High conductance
- Filling can be easily exchanged
- Improvement in the ultimate pressure attained by backing pumps by one order of magnitude
- Stainless steel housing and insert
- NBR gasket

Typical Applications

- Product of an oil-free vacuum

Supplied Equipment

- Complete with insert
- Without adsorbent

Residual gas spectrum; top ahead of a rotary vacuum pump, bottom ahead of a rotary vacuum pump with adsorption trap

UNIVEX High Vacuum Experimentation Systems

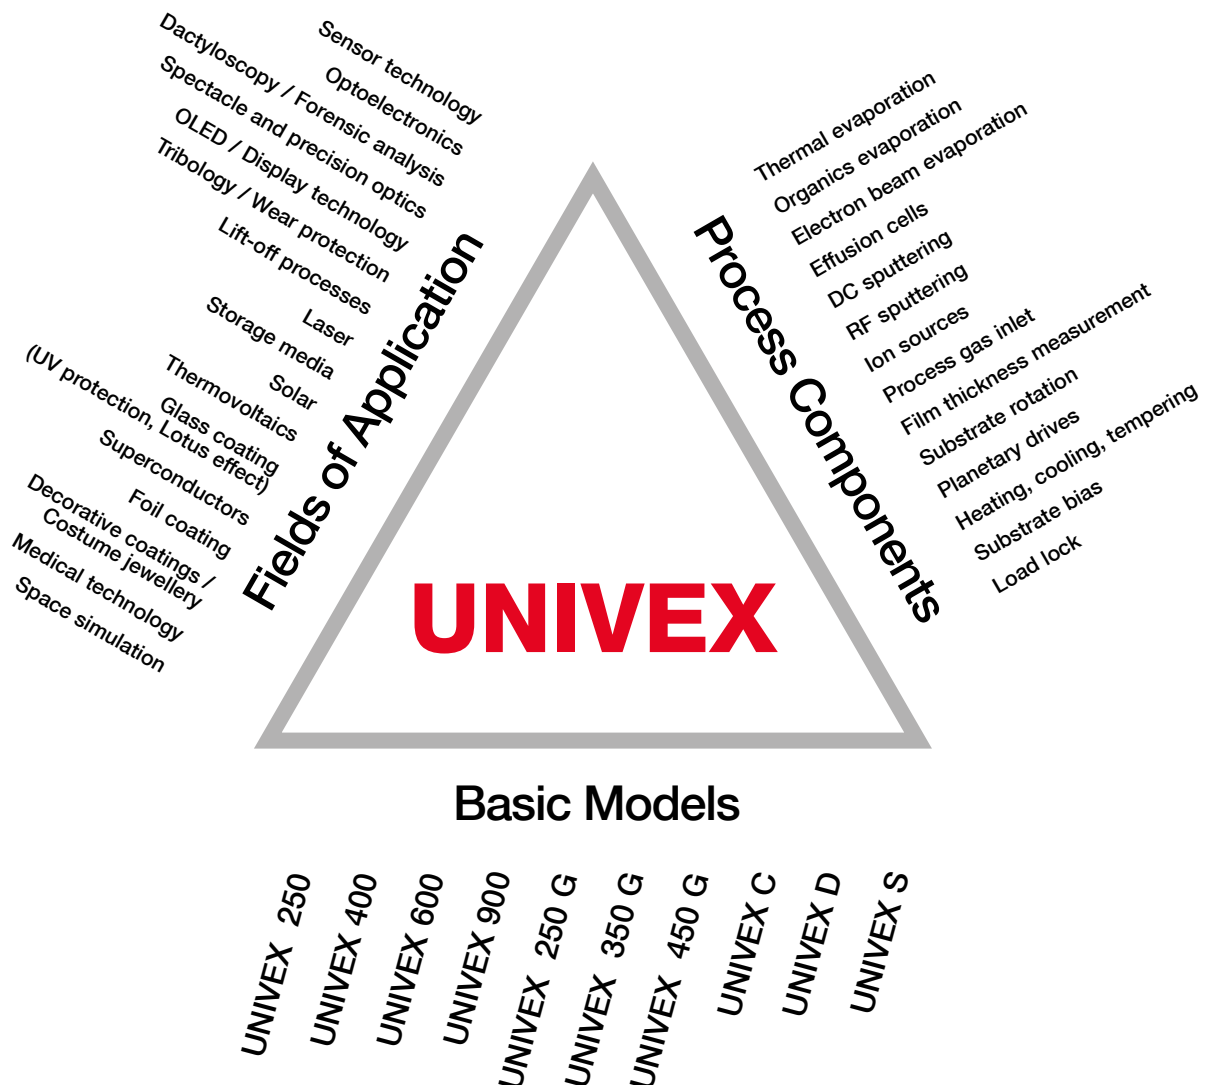

General

The UNIVEX system family was developed by Leybold for applications in research and development as well as for setting up pilot production units.

Their range of applications focuses chiefly on vacuum coating technology as well as vacuum process engineering experiments.

The multi-purpose experimentation systems from Leybold are modular and

can be specified according to specific customer requirements. For this purpose, a corresponding questionnaire is provided on the last pages of this chapter.

Box Coating Systems

Multi-purpose Vacuum Coating System for the Laboratory

Design

- Compact unit with direct access to the process chamber
- The UNIVEX box coaters systems consist of a process and a control module
- The process module includes the vacuum chamber, the coating components and the pump system
- The control module includes the PLC, respectively PC controller including the visualisation as well as the power supplies for the process components

Vacuum Chamber

- Box-shaped stainless steel vacuum chambers UNIVEX 250-600
- Octagonal stainless steel vacuum chamber UNIVEX 900
- Hinged front door for simple chamber access
- Viewing window with coating protection
- Removable stainless steel coating protection panels
- Flexible connections for chamber bottom and chamber top
- Connecting flanges for pump system and process components
- Coolable and heatable chamber walls optional

Vacuum System

- Mechanical forevacuum pump (dry compressing or oil sealed)
- High vacuum pump (turbomolecular or cryo pump)
- Vacuum valves
- Pressure measurement devices

Advantages to the User

- Modular system design
- Application-wise optimised pump system
- Multi-purpose vacuum chamber
- Convenient access to the chamber installations
- Very simple to operate and use via programmable control
- Suited for retrofitting of process components (configuration dependent)
- For installation into clean-room walls

Basic Models

UNIVEX 400

UNIVEX 600

UNIVEX 900

UNIVEX 250

Design example UNIVEX 250

The UNIVEX 250 is a cost-effective and compact entry-level coating system for the laboratory.

Owing to its low height of only approximately 1.2 meters it is ideally placed on a benchtop or installed in a frame.

In the vacuum chamber which is 270 mm wide, substrates up to an overall diameter of 220 mm max. can be rotated and coated.

The integrated PLC controller allows you to run manual, respectively semi-automatic coating processes.

Examples of equipped vacuum chambers

Chamber bottom:
double thermal evaporator with source shutter
Chamber top:
rotating substrate table with substrate shutter

Electron beam evaporator with fourfold rotating crucible as well as additional double thermal evaporator, each with source shutter

Effusion cell as well as spare blank flanges for subsequent retrofits

Glove Box Systems

Multi-purpose Vacuum Coating System for Fitting to a Glove Box

The UNIVEX glove box systems were developed to coat materials which are sensitive with respect to the environmental conditions like oxygen or humidity, for example

Design

- The UNIVEX glove box systems consist of a process module and a separate electrical cabinet
- The process module includes the vacuum chamber, the coating components and the pump system
- The control module includes the PLC, respectively PC controller including the visualisation as well as the power supplies for the process components

Vacuum Chamber

- Box-shaped stainless steel vacuum chambers UNIVEX 250 G – 450 G
- Sliding front door for easy chamber access through the glove box
- Swivelling rear door for simple chamber access
- Viewing window with coating protection
- Removable stainless steel coating protection panels
- Flexible connections for chamber bottom and chamber top
- Connecting flanges for pump system and process components

Vacuum System

- Mechanical forevacuum pump (dry compressing or oil sealed)
- High vacuum pump (turbomolecular or cryo pump)
- Vacuum valves
- Pressure measurement devices

Advantages to the User

- Modular system design
- Application-wise optimised system
- Flexible utilisation of the vacuum chamber
- Space saving installation to the rear of the glove box
- Convenient process access through

the glove box by means of a front sliding door

- Easy access to the chamber unit through the rear service door
- Very simple to operate and use
- Suited for retrofitting of process

components (configuration dependent)

- All system components with exception of the sliding door are accessible from outside the glove box

Design example

Cluster-Tool Systems UNIVEX C

Design example:
UNIVEX 450 C with coating module and electrical cabinet (example photograph).
The coating module consists of two process chambers (left and right) as well as the loadlock and transfer chamber in between
The substrate transfer between the chambers is effected with the aid of a vacuum robot

For special applications we can also supply cluster systems based on the UNIVEX concept. These clusters are equipped according to customer requirements and incorporate separate processing, load lock and transfer chambers.

Frequently sputter applications are involved since sputter targets remain in place for a long time and because of this, the process chambers need to be vented rarely.

Generally, each vacuum chamber will have its own high vacuum system. The load lock chamber is in the simplest case loaded manually with individual substrates. In addition, magazine processing of several substrates per batch is possible.

Design example:
UNIVEX 450 C with two process chambers as well as load lock chamber arranged at the centre. The substrates are moved using linear transfer rods (left and right)

Design example:
Automatically controlled substrate magazine with
robot arm access

Design example:
Load lock chamber with central vacuum robot for
substrate transportation into radially arranged pro-
cess chambers

For transporting the substrates between the individual vacuum chambers, commonly motor driven robot arms or linear transfer drive units are used.

The UNIVEX control software is customised according to the specific appli-

cation requirements and will generally allow fully automatic running of the process including recipe processing. Additional features like data logging, password protected and priority dependent user access as well as remote access for servicing can be optionally integrated.

Design example:
Coating module (centre) with decentralised pump systems (left and right) and control console

Dactyloscopy Systems UNIVEX D

Leybold has developed a coating system, which relies on a recognized metal evaporation process to reveal fingerprints on items containing fingerprint evidence.

Benefits of this method

- Easily controllable thermal coating process
- Coating of large areas is possible up to 800 x 400 mm
- Short cycle times are possible (depending on the material with the fingerprint evidence)
- Good contrast on multicolor surfaces
- The material containing the fingerprint evidence remains undamaged

Design example:

UNIVEX 450 D, consisting of vacuum coating module (right) and separate electrical cabinet (left)

Opened coating chamber with retracted substrate receiver

View into the chamber with thermal evaporator and positioned substrate receiver

Space Simulation Systems UNIVEX S

We are offering the UNIVEX S line for simulation of space conditions as well as other thermal vacuum experiments. It generally consists of a cylindrical vacuum chamber with high vacuum sys-

tem and supply module with process controller. The simulation chamber is typically equipped with temperature controllable trays and shrouds, which may be both

heated and cooled, in a vacuum. The process module is moved manually along rails so that the simulation chamber can be opened for loading

Design example:
UNIVEX 1000 S with closed simulation chamber

Opened chamber of the UNIVEX 1000 S with temperature controllable shrouds and substrate tray

Design example:
UNIVEX 700 S

Sample:
UNIVEX S XTT

Power Supply Unit

Thermal Evaporation of Low Melting Point Materials (organics)

Organic material evaporators are special instruments based on the thermal principle developed to evaporate mostly temperature sensitive organic materials.

Such instrumentation ensures a coating

process at precisely controlled heating temperatures in the range between 50 °C and 600 °C.

For installation within the UNIVEX systems, Leybold supplies organic

material evaporators as a complete package, consisting of evaporator source, automatic evaporator shutter and 19" rack mount controller.

Four organic material evaporators, arranged in a semicircle

Single organic material evaporator with shutter, fitted to a DN 40 CF flange

Power supply unit for two organic material evaporators

Upon request we shall be pleased to provide an offer which specifically matches the requirements of your application.

Electron Beam Evaporation

Various models of electron beam evaporators and power supplies are available for installation in the UNIVEX systems.

Electron Beam Evaporator

The selection of a suitable electron beam evaporator will primarily depend on the amount of available space, the desired evaporation rate and the film thickness as well as the number and type of materials which need to be evaporated. Single crucible as well as rotatable multi-crucible evaporators are available.

Electron beam evaporator with single crucible

Electron beam evaporator with rotatable six-pocket crucible

Power Supplies

The power supply unit for the individual electron beam evaporators is selected depending on the maximum evaporation power which is required, as well as the demanded properties for X/Y beam deflection. Models with output power ratings ranging from 3 kW to 10 kW are available.

Upon request we shall be pleased to provide an offer which specifically matches the requirements of your application.

Sputtering

Magnetron Sputter Sources

The magnetron sputter sources, which can be built into the UNIVEX systems, are DC/RF compatible. This means, they may be operated either with a DC or also with a RF power supply. In addition, pulsed DC power supplies are possible.

Here as standard round planar sputter sources with target diameters ranging from 2-in. to 6-in. are available. Selection and equipping here depends on the substrate size to be coated, the specified sputtering process and the target material as well as the available installation space.

Other target sizes and magnetron types (rectangular sources, for example) are available upon request.

2-in. magnetron with in-situ tiltable sputter head, pneumatically actuated target shutter and gas feed

4-in. magnetron with in-situ tiltable sputter head, pneumatically actuated target shutter and gas feed

Confocal arrangement of 3-in. sputter sources, aligned for sputter-up

DC Power Supplies

For DC sputtering, power supply units with a rated output power ranging between 500 W and 3 kW are available. These are 19-in. rack mount units which can be installed in the UNIVEX cabinets.

RF Power Supplies

For RF sputtering, power supply units with a rated output power ranging between 300 W and 2 kW are available. These are 19-in. rack mount units which can be installed in the UNIVEX cabinets.

Moreover, automatically controlled RF matchboxes are supplied for impedance matching between the RF power supply and the magnetron.

Gas Inlet

Sputtering sources can only be operated with a process gas present. For this, manually operated variable leak valves or automatically controlled mass flow controllers are available options.

Throttling the Pumping Speed and Process Pressure Control

In order to protect the high vacuum pump against the high pressures present during plasma operation and to control the process pressure, the UNIVEX systems are fitted with suitable components for throttling the high vacuum pumping speed. These may be butterfly valves, control gate valves or also speed controlled turbomolecular pumps.

Upon request we shall be pleased to provide an offer which specifically matches the requirements of your application.

Ion Sources

Ion sources are frequently used to either clean or etch the substrates before running the actual coating process, or to optimise the thin film properties during deposition. In the case of the latter process, the ion source serves to support the coating process (IBAD – Ion Beam Assisted Deposition). However, there are also some PVD processes, during which the ion source is directly needed to produce the thin films, for example during ion beam sputtering

As to design and operating principle, different types of ion sources are available, for example

- Gridded and gridless ion sources
- DC ion sources and RF ion sources
- Flange mounted ion sources and ion sources built in/aligned in the vacuum

Gridless DC ion source with filament for plasma neutralisation

Filamentless RF grid type ion source

**We shall be pleased to assist you in connection with your UNIVEX application.
For this, please ask us for a quotation.**

Process Gas Inlet

In plasma supported processes (sputtering, etching, glow discharge, bias) or reactive deposition methods, generally a gas supply from the outside is necessary. The gas may be supplied either manually with a gas-dosing valve or program-controlled by way of a gas

flow controller (MFC – Mass Flow Controller). The MFC control range is depending on the requirements between approximately 0 to 10 sccm and 0 to 500 sccm.

The available MFC models are equipped either with a 0 to 5 V ana-

logue interface or a EtherCAT interface. The possible gases respectively gas mixtures within a UNIVEX system depend on the type of required application and the installed system hardware (in particular the pump system).

Mass Flow Controller (MFC)

For controlled inlet of gas in connection with automated plasma processes (sputtering, etching, glow discharge). The MFC is controlled by a PC or a PLC provided from the side of the customer.

Technical Data

Gas flow, max.	sccm	selectable between 10 and 500
Supply voltage	V DC	24
Control interface		analog 0 – 5 V or EtherCAT

Variable leak valve with isolation valve	215 010

Variable Leak Valve with Isolation Valve

see also Catalog Part "Valves"

Please ask us for detailed information.

Film Thickness Measurement

Various thin film thickness measuring instruments may be installed in the UNIVEX units.

The selection depends on the measurements needed and the required degree of automation.

As standard, oscillating crystal systems are used. These may consist of one or several sensing heads with or without shutter, and upon request are available for UHV operation (i.e. are suitable for degassing).

The sensor head is driven either by a monitor (allowing only the measurement of deposition rate and film thickness) or by a controller (allowing measurement of the film parameters and control of the deposition rate).

Upon request we can provide an offer which specifically matches the requirements of your application.

Example of a thin film controller

Examples of thin film measurement gauge heads

Substrate Rotation

To attain the desired film properties, a rotary movement of the substrates is very often necessary in deposition processes.

The Leybold UNIVEX system is availa-

ble with a wide range of substrate rotation accessories.

A simple, manually operated rotation axis can be implemented just as a continuously revolving motor shaft or an

angle positionable solution (for placement or transfer tasks).

In addition, coaxial drives with two independently operated rotating tables can be offered.

Motor driven rotary drive with a detachable substrate holder (bayonet coupling).
View from the bottom onto the closed substrate shutter

Coaxial hollow shaft drive for eccentric rotation and positioning of several substrates, with separate shutter table

Planetary Drives

For high demands regarding thickness uniformity of the deposited film, planetary drives are suitable. Here the substrates, which are to be coated, are

placed on so-called planets. The planets revolve eccentrically about a central axis but they additionally rotate about their own centre point.

Different types of planetary drives are possible depending on the specific kind of task (size and number of substrates, angle of inclination, throughput times).

Planetary drive with gear drive and three planets, firmly installed, but where the angle is adjustable

Planetary drive with central friction disc and five free-running planets

**Our consulting experts are available to inform you about substrate movement options.
For these please ask us for a quotation.**

Heating, Cooling, Tempering, Bias

Rotatable thermal radiation heater with quartz lamps

Rotatable thermal radiation heater with quartz lamps during heating operation

The thermal manipulation of substrates is an important method to optimise coating results. For this, Leybold Vacuum offers within the scope of its UNIVEX systems numerous solutions. Depending on requirements and technical feasibility, thermal solutions may also be combined with other properties for example rotation or substrate bias.

Substrate Heating

For temperature-controlled heating, different contact and thermal radiation heaters are available. The selection of the optimal solution depends above all on the desired temperature range, the substrate size and the substrate material.

Rotating contact heater based on the resistance heating principle

Rotating high temperature thermal radiation heater with SiC heating element

Substrate Cooling

Heat sensitive substrates or substrate coatings necessitate during the deposition process some kind of cooling. Leybold offers both inactively as well as actively cooled substrate holders. As cooling media, water, liquid nitrogen (LN_2) or special cooling liquids can be used.

Rotating and water-cooled substrate table

Substrate Tempering

Through the utilisation of a special temperature control liquid, it is possible to heat or also cool a substrate. The possible temperature range lies between approximately $-50\text{ }^{\circ}\text{C}$ and $+150\text{ }^{\circ}\text{C}$ for static substrate holders, respectively $-20\text{ }^{\circ}\text{C}$ and $+100\text{ }^{\circ}\text{C}$ for rotating substrate holders.

Rotatable and temperature controllable substrate holder with substrate shutter

Substrate Bias

Pre-cleaning of the substrate with RF or DC biasing prior to deposition can improve the adhesive properties of the film. Leybold offers insulated substrate holders and upon request matching power supplies.

Insulated substrate fork with RF bias connection

Load Lock Systems

To improve the process conditions and to increase coating throughput, frequently additional load lock chambers are used. These are connected to the process chamber and are vacuum-wise separated by a gate valve. By means of a transport facility (linear transfer rod, vacuum robot or alike) the substrate is transported between the chambers. The load lock system offers the advan-

tage to save time during pumpdown and the ability to attain significantly better vacuum pressures in the process chamber, since it will not have to be vented when changing the substrates. Usually the load lock chamber will be significantly smaller compared to the process chamber. Selection of the load lock chamber and

the pump system as well as the design for the substrate transport facility depend on the specific kind of application.

We shall be pleased to assist you as to the possibilities offered by a load lock system in your UNIVEX application.

Manually operated load lock chamber with substrate magazine

Load lock chamber for a single substrate with automatically operated linear transfer unit

View into the opened load lock chamber onto the substrate end effector

General Accessories

Blank-Off Screw Fitting

For 34.5 mm dia. hole.

Blank-off screw fitting

Technical Data

Material	Stainless steel
Seal	FPM (FKM)
Weight	kg 0.1

Blank-Off Screw Fitting

Ordering Information

	Part No.
Blank-Off screw fitting	030 40

Blank-Off Screw Fitting

PS 113 A Low Pressure Safety Switch

Safety interlock arrangements in connection with the UNIVEX system controller, respectively optionally connected power supply equipment (for sputtering or electron beam evaporation, for example).

PS 113 A Safety Switch

Technical Data

Switching pressure	mbar	approx. 6 below atmospheric pressure
Return switching pressure	mbar	3 below atmospheric pressure
Switching inaccuracy	mbar	2
Switching contact		Changeover contacts, gold-plated, for prog. controls
Switching capacity	mA / V AC mA / V AC	100 / 24 30 / 24
Vacuum connection	DN	16 ISO-KF

Low Pressure Safety Switch

Ordering Information

	Part No.
Low Pressure Safety Switch PS 113 A, DN 16 ISO-KF; complete with 3 m long cable	230 011

Low Pressure Safety Switch

see also Catalog Part "Measuring, controlling"

Overpressure Safety Valve

For protecting the vacuum chamber against atmospheric overpressure during gas inlet

Dimensional drawing for overpressure safety valve

Technical Data

Responding pressure	mbar	1150 ± 40, over-pressure
Flow at 140 mbar	l/h	500
Valve disk		Spring loaded, with O-ring seal
Leak rate in the closed state	mbar x l/s (Torr x l/s)	< 1 x 10 ⁻⁸ (< 0.75 x 10 ⁻⁸)
Connection	DN	16 ISO-KF

Overpressure Safety Valve

Ordering Information

	Part No.
Overpressure Safety Valve	890 39

Overpressure Safety Valve

see also Catalog Part "High Vacuum Pumps"

Vacuum Feedthrough for the Transfer of Electrical Signals

For installation in a 34.5 mm diameter installation bore.

Connection on the side of the atmosphere through a six-way plug (included in the delivery).

Connection on the vacuum side through a plug with soldered contacts (included in the delivery).

Vacuum feedthrough

Pneumatically Actuated Swivelling Shutter

For covering substrates or coating sources like thermal, respectively electron beam evaporators.

With pneumatic drive unit and shutter panel; for installation within installation bores having a diameter of 34.5 mm.

Technical Data

Rating per conductor	V A	max. 700 16
Seal		FPM (FKM)
Weight	kg	0.3

Ordering Information

	Part No.
Vacuum feedthrough	upon request

Technical Data

Control voltage	V DC	24
Dimensions of the shutter panel	mm	upon consultation

Ordering Information

	Part No.
Pneumatically actuated swivelling shutter	upon request

Calibration Systems

General

CS Calibration Systems

The requirements imposed on vacuum engineering with regard to accuracy of the measurements, reproducibility and unambiguity of the determined vacuum pressures have increased steadily over the last years

Routine calibrations of vacuum gauges are an important component of quality assurance schemes. The calibration systems from Leybold put the customer in a position to check and recalibrate on his own the specified and necessary accuracy of his vacuum gauges. Calibration systems are available for this

purpose which cover a calibration range from 1000 mbar to 1×10^{-7} mbar (750 to 0.75×10^{-7} Torr).

Each system is equipped with several certified reference pressure sensors (transmitter standards), which each cover a part of the specified range of calibration pressures. In the pump system, TURBOVAC turbomolecular pumps with DIVAC diaphragm pumps are used. A variable leak valve is used to let the gas into the calibration chamber. In the case of the calibration system CS7, the gas inlet line is, moreover, equipped with its own pump system.

The CS3 Advanced is a compact, wheeled version and therefore movable. In addition, the CS3 Advanced has a manual pump bypass, which allows a continuous dynamic calibration across the entire pressure range.

The CS7 is equipped with a heater for the vacuum chamber, for the purpose of attaining lower chamber pressures more rapidly. The temperature of the heating collars can be controlled whereby the maximum degassing temperature will depend on the components installed (flanges, pressure sensors, valves).

Calibration system CS3 Standard

Calibration system CS3 Advanced

CS7 calibration system

Advantages to the User

- Vacuum gauges and measurement systems of any make may be calibrated
- Designed in accordance with DIN 28 418 resp. ISO/DIS 3567
- Transfer standards with PTB-, DAKK- or factory certificate
- Easier DIN/ISO 9000 approval
- Reliable and reproducible measurements
- Quick start-up
- Measurement system free of hydrocarbons through the utilisation of dry compressing vacuum pumps
- Simple operation
- CE approval

Products
